Deal Outcome by Industry

EXECUTIVE SUMMARY

This dashboard analyzes order fulfillment, customer segmentation, and sales pipeline performance for a business across 720 orders, 143 customers, and multiple vendor relationships spanning across more than 8 countries. Overall, the business shows a healthy order completion rate of 80% but faces measurable delivery delays and a sales pipeline with -- of sales closed and -- win rate, both of which represent clear areas for operational improvement.

KEY INSIGHTS

Order Fulfillment & Revenue

- Of 720 orders, 576 (80%) were successful, generating 9M in revenue from orders, while failed orders still account for a notable 2M in lost.
- Average delivery time sits at 6.67 days company-wide, but this varies meaningfully by country. Nigeria (7.62 days) and Canada (7.20 days) lag behind faster markets like Australia (6.11 days) and the Netherlands (6.32 days).
- Order status breakdown shows 35% cancelled, 26% failed, and 39% in transit, meaning over 60% of non-delivered orders never reach the customer at all, which is a larger issue than shipping speed alone.
- The monthly revenue trend (successful vs. failed order value) shows successful order value consistently outperforming failed value, but both lines fluctuate together, suggesting failed-order losses scale with overall order volume rather than easing over time.

Customer Segmentation

- The customer base splits into three tiers: Starter (50), Growth (57), and Enterprise (36). Growth is the largest segment, but Enterprise customers carry the highest minimum annual revenue (3K vs. 790 for Starter), making them disproportionately valuable despite being the smallest group.
- Customer distribution by country/industry shows concentration in a handful of markets, with the UK, US, and Germany carrying the heaviest counts. This could be useful for prioritizing regional support or account management resources.

Vendor Performance

- Vendor ratings range from 3.40 to 4.70, with Vendor 07 (4.70 rating, 47 fulfilled) standing out as a top performer, while some vendors combine lower ratings with high fulfillment volume (e.g Vendor 01: 3.40 rating, 47 fulfilled) a potential quality-vs-throughput tradeoff worth investigating.

Sales Pipeline

- Of 96 closed deals, the win rate is 62.5% won vs. 37.5% lost, a workable but improvable conversion rate.
- The top reasons for lost deals are evenly spread: Budget, Feature Gap, and Timing (6 each), followed closely by Competitor and No Response (5 each). There is no single dominant cause, suggesting losses stem from multiple unresolved friction points rather than one fixable issue.
- Deal outcomes by industry show Won vs. Lost is fairly balanced across most industries. With no single vertical dramatically outperforming others, pipeline quality issues appear structural rather than industry-specific.

RECOMMENDATIONS

- Investigate the Cancelled/Failed order segment (61% of non-delivered orders). Since this outweighs delivery-speed issues, root-cause analysis on *why* orders are cancelled or failed (before they even reach transit) should be prioritized over shipping optimization.

- Target delivery-time improvement in Nigeria and Canada, the two slowest markets and closing half the gap to the fastest markets (Australia, Netherlands) could measurably lift customer satisfaction and reduce failed-order risk tied to delays.

- Re-evaluate vendors with high fulfillment volume but low ratings (for example Vendor 01).

- Protect and grow the Enterprise segment. With the highest revenue floor per customer despite being the smallest group by count, targeted retention or upsell efforts here likely yield more return than broad Starter-tier acquisition.

- Address the "Budget" and "Feature Gap" lost-deal reasons directly in the sales process .Since there is no single reason dominates, a multi-pronged fix (competitive pricing options as well as smoother objection handling) is more effective than a single initiative.
